ICT & SMART MONEY CONCEPTS

LECTURE 04

Module 5: Entry Models — The Power of Three (AMD)

Module 6: Candle Range Theory (CRT)

Risk Disclaimer

ICT/SMC is a discretionary chart-reading methodology, not a guaranteed system. Trading leveraged instruments (forex, indices, crypto) carries a high risk of loss. This material is for educational purposes only and is not financial advice. Students should never trade with money they cannot afford to lose, and should practice on a demo account before risking real capital.

Module 5: Entry Models — The Power of Three (AMD)

Power of Three (PO3)

The Power of Three (PO3) is a simple but powerful framework taught by ICT that describes how smart money typically moves the market over a specific period, usually a day.

1. Accumulation — a range where price consolidates
2. Manipulation — a fakeout or liquidity grab that tricks traders
3. Distribution — the real move in the intended direction

It's called the Power of Three because these three steps repeat over and over — daily, weekly, even intraday.

What You'll Learn to Recognize

- When not to trade (accumulation)
- What the trap looks like (manipulation)
- When the real move begins (distribution)

Fig 5.1 — The Power of Three: Accumulation, Manipulation, and Distribution across a session

Fig 5.2 — A real PO3 cycle marked directly on a price chart

Accumulation

Price consolidates in a tight range while smart money builds a position, without moving price much in either direction.

Fig 5.3 — Accumulation: price ranging between a defined high and low

Manipulation

Price sweeps liquidity just outside the accumulation range — a fakeout designed to trap traders who entered on the breakout — before reversing hard in the true direction.

Fig 5.4 — Manipulation: liquidity is swept, then the move fakes out before reversing

Distribution

The real, sustained move in the true intended direction, after the manipulation phase has trapped and squeezed out the opposing side.

Fig 5.5 — Distribution: the genuine directional move following the manipulation phase

Instructor Tip

Draw the PO3 cycle as a simple checkmark shape on the whiteboard first, before showing it on a real chart — students grasp the shape faster in the abstract before applying it to noisy price data.

Practice Assignment

1. Find one full PO3 cycle on your chosen chart within a single trading day

2. Label the accumulation range, the manipulation spike, and the distribution move separately
3. Note which kill zone (from Lecture 03) each phase occurred in
4. Explain what liquidity pool the manipulation phase most likely targeted

Module 6: Candle Range Theory (CRT)

Candle Range Theory (CRT) is a viral trading concept that maps a higher-timeframe candle as a range on the lower timeframe, and uses the liquidity raid of that range as the trigger for the trade.

What is Candle Range?

Before understanding the candle range, you should have a basic knowledge of the candlestick. Take one higher-timeframe candle (for example, a 4-hour candle) and treat its high and low as a defined range. That range can then be analyzed on a lower timeframe (for example, 15-minute) the same way you would analyze any other range.

Fig 6.1 — A single 4-Hour candle: its high and low define the CRT range

Fig 6.2 — The same range viewed on the 15-Minute chart, where the actual entry is timed

Bullish CRT Model

If price is at a key support level on a higher timeframe, you can look for a bullish CRT model: price sweeps below the CRT-Low, then reverses back up through the range.

Fig 6.3 — A 2-Hour bullish CRT setup: price sweeps into FVG-Support below CRT-Low before reversing

Fig 6.4 — The 5-Minute confirmation: an MSS forms, and price rallies from CRT-Low toward CRT-High

Bearish CRT Model

When price is at a key resistance level on a higher timeframe, you can look for a bearish CRT model: price sweeps above the CRT-High, then reverses back down through the range.

Fig 6.5 — A 4-Hour bearish CRT setup: price rejects from CRT-High and breaks down through CRT-Low

Fig 6.6 — The 5-Minute confirmation: price sweeps the Asia-High, forms an MSS, then sells off from CRT-High to CRT-Low

Instructor Tip

CRT is easiest to teach as 'the same range-and-sweep logic from liquidity and inducement (Lecture 03), just applied to a single higher-timeframe candle instead of a session.' Use that direct comparison to speed up understanding.

Practice Assignment

1. Pick a 4-Hour chart and mark three instances where the next candle swept the prior candle's high or low before closing in the opposite direction
2. For each, mark the CRT-High and CRT-Low and the sweep point
3. Drop to a 5-minute or 15-minute chart for one instance and mark the MSS that would have confirmed the reversal in real time
4. Note whether each setup was a bullish or bearish CRT model, and which kill zone it occurred in

Coming Up in Lecture 05

STD (Standard Deviation) projections and building your Personal Strategy — combining market structure, liquidity, order blocks/FVGs, PO3, and CRT into one repeatable, rules-based entry checklist.
